provider

the adopt

A number of workshop participants volunteered and will thus drive the core of the follow-up progress during the next W3C Technical Ple

At the more minute level, the workshop also

- Exposure of HTTP Server Push to userland managed by a Service Worker. This will be
- Continued exploration of the role of browser

During the two days, participants reviewed opportunities that bring to the 5G network.

The workshop concluded with the proposed creation of a task

## About the Web &amp; Networks Interest Group

## What we do

*The mission of the Web & Networks Interest Group is to explore solutions for web applications to leverage network capabilities in order to achieve better performance and resources allocation, both on the device and network.*

## Who we are

Chairs:

- Dan Druta (AT&T)
- Sudeep Divakaran (Intel)
- Song Xu (China Mobile)

Staff Contact: Dominique Hazael-Massieux [<dom@w3.org>](mailto:dom@w3.org)

## Work streams

The group is currently focused on two main topics:

- [Network Quality Monitoring and Prediction](#) with the goal of improving how Web apps can monitor and prepare for changes in network conditions
- [Edge Computing](#) with the objective of understanding the impact of edge computing for Web applications and build a roadmap to enable its adoption

## Get involved

We welcome comments and discussion from the web community, on [GitHub](#) and our mailing list [public-networks-ig@w3.org](mailto:public-networks-ig@w3.org) ([publicly archived](#)).

We also welcome new members:

- [Participate in W3C](#)
- [Join the Interest Group \(needs a W3C account\)](#)
- [W3C code of conduct](#)

## Our charter

The [current charter](#) of the Interest Group runs until 31 December 2020.

# 仕様案に対するレビュー

## W3C Process Document

- The requirements for wide review are not precisely defined by the W3C Process. The objective is to ensure that the entire set of stakeholders of the Web community, including the general public, have had adequate notice of the progress of the Working Group (for example through notices posted to public-review-announce@w3.org) and were able to actually perform reviews of and provide comments on the specification.

## W3C Process Guidebook

- Some of the key groups where there could be dependencies include:
  - [WAI Accessible Platform Architectures \(APA\) Working Group](#) (for accessibility)
  - [Internationalization Working Group](#)
  - [Security Interest Group](#) (for security)
  - [Privacy Interest Group](#) (for privacy)
  - [Technical Architecture Group](#) (for technical architecture principles)

# 仕様案に対するレビュー

## Memorandum of Understanding Between W3C and WHATWG

- 3.3 W3C shall encourage the community (users and developers alike) and horizontal review groups to contribute directly to the WHATWG HTML and DOM repositories; raising issues, proposing solutions, commenting on proposed solutions, and indicating support or otherwise for proposals. Those contributions will be subject to the WHATWG IPR Policy (see “Patent and Copyright”, below). The WHATWG repositories may add custom labels to enable the HTML WG to organize and manage issues of interest to the W3C community.
- 3.7 W3C and WHATWG jointly agree that the TAG may provide non-binding technical advice on any complex disagreements.

# プロセス更新議論 – Ever\*

## Memorandum of Understanding Between W3C and WHATWG

- W3C has no obligation to bring every Review Draft to REC, but expects to do so at least once per 12 month period. Consistent with WHATWG's policies and normal course of operation, a new WHATWG Review Draft will be published approximately every six months. The HTML WG can take the newly published Review Drafts for the HTML and DOM specifications to REC. The HTML WG may request that WHATWG publish a WHATWG Review Draft outside the normal course of operation; WHATWG will make reasonable efforts to produce such Review Draft.

# プロセス更新議論 – Ever\*

仕様へ入れるためのコンセンサス確保もしくはグループ内・エディターレビューの方法、特許ポリシーとの整合(とはいえ現状のRECでないとならない、RFでない、という点の問題は共有されている)、リエゾン・一般を含む各グループによるレビューの取り込み方、などについてまだいくつかの議論が行われている。

- 永続的CRや、継続的に更新可能なREC、など
  - 現在は更新の為にFPWDかCRに戻ってプロセスをやり直す必要
- whatwg Living Standard (LS)は部分ごとに各レビューなどが実施されている
  - wptでのテストの存在や最低一つの実装が必要ななどのgithub PRのマージ基準が存在

# horizontal reviewプロセス 整理と共通化整備

- 各WGは公開予定の仕様に対して
  - charterでレビューを要請する(最低限の)グループをリスト
  - FPWD公開時に各グループに連絡、CR公開前に各グループからのレビューを完了させる
- 各グループはレビューに関して
  - Self check listをRequest HR of TTML2 #75

# Short i18n review checklist

This page points developers of specifications to various aspects of their spec that may be of interest to spec reviewers, to get an idea of what to look for in a spec.

The text of this page is still being perfected, and is not exhaustive. Please raise a pull request if you have suggestions.

If the spec or its implementation...	
... contains <b>any natural language</b> text that will be read by a human (this includes error messages or other UI text, JSON strings, etc, etc),	... ensure that there's no ambiguity in things such as language, units, etc.
... allows content authors to produce <b>typographically appealing text</b> , either in its own right, or in association with graphics.	... take into account the needs of users around the world (for text alignment, justification, emphasis and units, etc.)
... allows the user to <b>point into text</b> , creates text fragments, concatenates text, allows the user to <b>select or step through</b> text (using a cursor or other methods), etc.	... make allowances for the needs of users of text
... allows <b>searching or matching</b> of text, including syntax and identifiers	... understand the implications of such operations etc
... <b>sorts text</b>	... ensure that it does so in a way that is appropriate for the user
... <b>captures user input</b>	... ensure that it also captures the user's text direction, and that the user can change it
... <b>deals with time</b> in any way that will be read by humans and/or crosses time zone boundaries	... ensure that it will read correctly around the world, and that it can handle global/absolute time
... allows any <b>character encoding</b> other than UTF-8	... make sure you have a way to handle it, then ensure that the user can change it
... <b>defines markup</b>	... ensure support for the user's preferred markup

## Check against i18n Review Checklist #582

**Closed** takuki opened this issue on 26 Apr · 1 comment

takuki commented on 26 Apr • edited by mkovatsev

Member + 😊 ...

Short i18n review checklist is [here](#)

- ☒ If the spec (or its implementation) contains any natural language text that will be read by a human (this includes error messages or other UI text, JSON strings, etc, etc),  
  
The TD spec itself does not contain such text.  
However, the TD spec defines fields "support", "description" and "title" with which the authors of TD can add natural language texts that can be read by a human.  
For Language Basics, see issue #[TBD] (@mryuichi)  
For Language Values, see issue #595 (@ashimura)  
For Declaring language at the resource level, see issue #584 (@mmccool)  
For Handling base direction for strings, see issue #585 (@mmccool)
- ☒ If the spec (or its implementation) allows content authors to produce typographically appealing text, either in its own right, or in association with graphics.  
  
**N/A (Not Applicable)**  
TD authors are not expected to produce typographically appealing text.  
TD does not provide a means to do so, either.
- ☒ If the spec (or its implementation) allows the user to point into text, creates text fragments, concatenates text, allows the user to select or step through text (using a cursor or other methods), etc.  
  
**N/A (Not Applicable)**  
TD users are not expected to do such operations.  
TD does not provide a means to do so, either.
- ☒ If the spec (or its implementation) allows searching or matching of text, including syntax and identifiers
  - TD spec contains "id" field of a Thing for identifying a Thing.
  - The "id" field is defined to be of anyURI type of XSD 1.1.
  - An implementation of TD itself does not do an operation of matching identifiers.

# Internationalization techniques:

## Developing specifications

This page provides checklists for specification developers, editors and reviewers who want to take account of internationalization issues during the development of a spec. Where a checklist item is followed by a `more` link, click on that for more information. The page also lists links to useful resources on the W3C Internationalization Activity site and elsewhere that may help.

Use of this checklist doesn't remove the need for a formal review, but using it for a self-review can warn of potential issues and requirements, at an early stage, that might otherwise be overlooked. Therefore, the later review should yield few, if any, nasty surprises. It also provides a useful set of points for reviewers to follow.

**Interactive checklists!** If your spec is github based, you can now create a snapshot of the checklist items in markdown. If you add that to a github issue, you can check off items that are ok, and add comments while doing a self-review. [Generate the code here](#).

The Devices and Sensors Working Group requests wide review of the following specs. The only substantial change since the last CR is the the addition of WebDriver extensions. Please provide your feedback by 2019-11-14.

WebDriver API and its extensions enable test automation and are not web-exposed in a normal browsing scenario. The extensions in scope of this review request are defined in the following Automation sections:

Generic Sensor API

<https://w3c.github.io/sensors/#automation>

Accelerometer

<https://w3c.github.io/accelerometer/#automation>

Gyroscope

<https://w3c.github.io/gyroscope/#automation>

Orientation Sensor

<https://w3c.github.io/orientation-sensor/#automation>

The group requests feedback via the respective specifications' GitHub repositories, or via email to [public-device-apis@w3.org](mailto:public-device-apis@w3.org).

The group is looking for confirmation that it has satisfied its relevant technical requirements and dependencies with other groups.

Thanks,

-Anssi (Devices and Sensors WG co-chair)

Check states of four specifications on automation sections, see **no** item relates to natural language, user input, date/time, nor cultural norms. All values are defined in SI units or normalized (by means of vector/matrix).

detail notes:

## Generic sensor

- No handling of natural language or user input
- This defines framework, mock sensors does not define return value syntax (nor unit), data formats

The WHATWG publishes a Review Draft of the DOM Standard every six months. The HTML WG plans to take alternate Review Drafts to W3C Recommendation, starting with the current DOM Review Draft.

Once this process is established, we expect wide and horizontal review to happen on an ongoing basis as the DOM specification evolves in WHATWG space. For this first attempt we need to do things a little differently though, and so we're officially inviting wide and horizontal review of the June 2019 DOM Standard Review Draft [1].

Issues identified during wide and horizontal review should be filed directly on the WHATWG DOM repository [2], but please let the HTML WG have a pointer to the mechanism or place where you track your issues by email to [public-html@w3.org](mailto:public-html@w3.org).

We expect issues to be opened, discussed, and resolved in WHATWG space, but the HTML WG can provide an escalation point if one is needed. The WHATWG FAQ explains how to raise issues there [3].

We plan to open the CFC to adopt the DOM Standard Review Draft - W3C CR is ready. Members would appreciate all you can do to turn around your review by the end of the month (if possible).

If you have questions, or if we can provide any guidance on how to file an issue, please let us know.

# classes are compared without Unicode normalization #793

bert-github opened this issue on 1 Nov · 3 comments

 bert-github commented on 1 Nov

+ 😊 ...

In 4.4. [Interface Node](#), or more precisely:  
<https://dom.spec.whatwg.org/review-drafts/2019-06/#concept-getelementsbyclassname>

The comparisons for the classes must be done in an [ASCII case-insensitive](#) manner if root's node document's mode is "quirks", and in a [case-sensitive](#) manner otherwise.

The links define the comparisons to be code unit by code unit, respectively code point by code point, but do not say anything about normalization. Two classes from two different documents may thus be [canonically equivalent](#) according to Unicode and still not match under this definition of case sensitive comparison.

(Note: this comment is part of a review on behalf of the W3C I18N WG, but the I18N WG has not yet discussed the comment.)

Historically the i18n WG has been supportive of not normalizing identifiers. I also doubt anyone would be interested in adding such complexity here.

## Abstract

This document describes and prioritises gaps for the support of Arabic and Persian languages on the Web and in eBooks. In particular, it is concerned with text layout. It checks that needed features are supported in W3C specifications, in particular HTML and CSS and those relating to digital publications. It also checks whether the features have been implemented in browsers and ereaders. **This is a preliminary analysis.**

# Review comment tracker

This page tracks comments made by the i18n WG on the specs of other WGs. It only shows tracker issues the i18n WG has not closed. (Issues may remain open in the i18n tracker even if closed by the other WG in their repo.)

The sections and items within those sections are ordered by the last modified date of the items in the *tracker* repository (not the discussions). The mostly recently changed items appear highest. The link on the left of each line links directly to the issue where the discussion is taking place. The date indicates when the *tracker* item was modified, and the right-hand column links to the issue used to track the discussion in the [i18n-activity github repo](#).

There are 318 issues.

Apple recently decided to [add support](#) for phonetic name in its Payment Request API's `PaymentAddress` object.

In Japan, people use 3 different characters - Kanji, Hiragana and Katakana. Texts are usually written in mixture of those 3 characters. While Kanji is written for content words, Hiragana and Katakana (they are equivalent different shapes) are written for phonetics. Names written in Kanji needs accompanying Hiragana or Katakana in order to be pronounced properly. That's where phonetic name field helps. They exists commonly in checkout forms in Japanese ecommerce services.

Therefore, I would like to propose to add `DOMString phoneticName` as a member of `PaymentAddress` object.

Could definitely add it in 1.1... This is similar to discussion we had here: [#480](#)

@agektmr, any idea what the attribute is? If not, @aestes will let us know :)

Correction: just wanted to confirm `phoneticName` is what Safari added. If so, then yeah... super easy to add.

4.2 Override Mechanism for Exceptions  
<http://www.unicode.org/reports/tr53/>

The default display order implemented by the UAOA will be correct for most uses. However, these are situations where a different mark order is desired. In these cases, U+034F COMBINING GRAPHEME JOINER (CGJ) can be used to achieve the desired display order.

Question:

It isn't really clear to me, but i'm guessing that the expectation is that content authors will use the CGJ in their content prior to application of the UAOA rules, rather than as an additional step in ordering text per the UAOA rules.

Editorial suggestion:

If that assumption holds, I'm surprised that the UAOA algorithm in section 3.2 doesn't mention that CGJ is a non-starter. For example, the step "Move any shadda characters ... to the beginning of S" should presumably not apply to a shadda that is preceded by CGJ.

I submitted a long individual feedback. Here's the part related to this issue:

### 4. Consequences of the Algorithm: Semantics

With UAOA applied on text during rendering, some strings collapse into a single sequence. Basically, there are plenty of strings X and Y, where  $\text{toNFC}(X) \neq \text{toNFC}(Y)$ , but  $\text{UAOA}(\text{toNFC}(X)) = \text{UAOA}(\text{toNFC}(Y))$ .
